

Just like phishing
tries to trick people,
prompt injections try
to trick AI systems.

With prompt injections, bad actors hide harmful and carefully worded instructions in websites and emails to trick AI into doing something it shouldn't, like revealing your sensitive information.

Here are some things we do to help protect against this:

- Train our models to ignore these harmful instructions
- Build layered security systems that block suspicious behavior
- Rapidly block new attacks once discovered
- Continuously ship improvements to model safety and data protection

Here are some tips for staying safer when using AI:

- 1 . Be specific in your prompts and aware of what you input
- 2 . Be careful and supervise when using agent features
- 3 . Use settings and tools to take control over your experience
- 4 . Double check any connected accounts or data sources and disconnect ones you're not using
