"My favorite enterprise AI service is Cursor. Every one of our engineers, some 40,000, are now assisted by AI and our productivity has gone up incredibly."

Jensen Huang
President and CEO of NVIDIA

Agenda

1. Measuring Productivity
2. Productivity Research Study
3. Customer Case Studies
4. Adoption & Rollout Strategies
5. Organizational Impact
6. Developer Productivity Features

Measuring Productivity

Where Engineering Focus Shifts

Accelerated by AI (<i>2-5x gains</i>)	Where Engineers Spend More Time
• Onboarding • New Code • Code Refactors • Writing Tests	• Planning & Design • Code Reviews • Security & CI/CD • Maintainability & Extensibility

Planning & design will remain the most important focus, since it relies on creativity and problem-solving, and is hardest to automate.

Rethinking Productivity

Cursor = AI-native IDE

Our Team: 100% AI-first workflows.

Front row seat into how AI reshapes productivity.

Old Metrics	New Question
• Lines of Code • Commits • Active Users	?

Beyond the Basics: Menu of Metrics

Usage ≠ Value.
Leaders must measure what truly drives outcomes.

Velocity	Quality
• PR Velocity • Story Point Velocity • Feature Completion Velocity	• Number of Defects • Test Coverage Gains • <u>Code Half-Life</u>
Developer Sentiment	ROI
• Satisfaction Surveys • Core Adoption	• Onboarding Speed • Cost per PR, Story Point, or Feature • Time-to-Market Acceleration

Productivity Research Study

Organization-level
output increased
by 39% with
Cursor.

AI Agents, Productivity, and Higher-Order Thinking: Early Evidence From Software Development

Suproteem K. Sarkar
University of Chicago

November 6, 2025 (Preprint)

Adoption of agents To measure how AI has been adopted for software development and how people use agents, I study a sample of 1,000 organizations that adopted Cursor—a platform for AI-assisted programming. The platform is used by people working in sectors including software, finance, and media. It is primarily used by people working in software roles, who make up 76% of users in the sample. It is also used by people working in other roles like data science, product management, and design. The platform is used by both individual contributors and managers, and is adopted across levels of work experience.

In November 2024, the platform released a coding agent that integrates language models with external tools. These tools include codebase search, web browsing, and command execution, and allow agents to interact with codebases and external data. The agent feature is adopted by most users of the platform—by July 2025, the feature was used by 92% of active users and all active organizations in the sample.

While most agent users work in software roles, agents are also used by people working in roles and sectors with traditionally lower engineering intensity—including managers, designers, and workers at consulting firms. Software engineers submit 52.1 agent messages per week. Meanwhile, designers submit 74.7 agent messages per week and accept code 1.14 times as often as software engineers do. Given current agent capabilities, people may be more likely to delegate tasks that are verifiable over short horizons to agents.

Teams merged 39% more pull requests after Agent became the default mode

More experienced developers are more likely to accept Agent-generated code

**Most Agent conversations begin
with implementing or planning**

Customer Case Studies

Cursor x Salesforce

Over 90% of Salesforce engineers use Cursor to build faster and ship with higher quality.

Double-digit gains in velocity and quality

With 20,000 developers and a 30GB codebase, Salesforce saw measurable improvements in cycle time, code quality, and throughput after adopting Cursor.

Tens of thousands of developers coding with AI

Cursor is part of daily workflows across teams, helping junior engineers understand legacy systems and senior engineers prototype and review code faster.

Building AI into engineering culture

Salesforce tracks impact through dashboards showing real-time gains. Clear governance and shared success stories help teams scale AI responsibly.

2X

double-digit gains in code quality and velocity

“AI is transforming how software is written and designed. We’ve seen a huge improvement in the quality of products.”

Shan Appajodu
SVP of Engineering, Salesforce

Cursor x Stripe

Stripe trusts Cursor to generate code with a six-nines reliability target.

Shaving hours off setup and debugging so engineers ship on day 1

Cursor comes preinstalled on every Stripe machine, removing setup friction and letting developers start coding immediately.

5-year high in developer sentiment

Internal surveys show Stripe’s developers are more satisfied than at any point in the last five years, citing smoother workflows and faster progress.

Prototypes in hours, not days

AI handles repetitive code so engineers can focus on architecture and UX—speeding up experimentation across teams.

Preinstalled on every developer machine.

Adoption led by internal power users.

“AI and Cursor opened up new skillsets for engineers. It’s helping people move beyond their comfort zones.”

Scott MacVicar
Head of Developer Infrastructure, Stripe

Adoption & Rollout Strategies

Enterprise Adoption: Cultural Shift

100% trying AI $\neq$ 100% deeply using AI

- 1 **Define the Why:** tie AI to outcomes
- 2 **Lead from the Front:** leaders must model behavior
- 3 **Create Champions & Catalysts:** empower early adopters
- 4 **Evolve the Culture:** align HR incentives

**Adoption isn't about deploying new tools:
it's about building trust and changing habits.**

Cursor Adoption Plan

Cursor Rollout Journey

Objectives

- Transform technical and non-technical team members from siloed contributors to high-ownership builders.
- Unlock a culture of rapid shipping through ease of writing code.
- Hyper focus on reducing bottlenecks.

Organizational Impact

Organizational Impact of AI: 4 Big Shifts

- 1 **Skills Multiply:** from T-Shaped to Barrel-shaped
- 2 **Pods Replace Teams:** pods of 2-3 ship end-to-end
- 3 **Experience is Disrupted:** AI coachability replaces years of experience
- 4 **Rituals Disappear:** sprints & standups are replaced by continuous delivery

At Cursor, single engineers own entire features end-to-end.

The Evolution of Developer Productivity

Organizational Impact

- Cross-functional product pods replacing specialized silos
- Engineers working across full stack
- Dramatically reduced onboarding time with AI
- Concept-to-production cycles measured in days, not quarters

The Strategic Imperative

- Not "doing more with less developers"
- Unlocking unprecedented innovation to stay ahead of competitors who are already making this shift.

AI Maturity Curve for Eng Orgs at Scale

Cursor helps teams move safely along that curve, step by step.

Enhanced ROI Analytics

New metrics like
PR velocity, cycle
time, and revert
rate

Coming Soon

Forward-Looking Challenge

The Risk

Outdated metrics and structures **drive the wrong decisions.**

The Opportunity

Measure productivity and ROI to double down on what works.

The Future

AI-native orgs won't be 10% faster. They'll out-ship competitors 10x.

At Cursor, we've seen AI-first workflows unlock this level of both velocity and quality.
